BLOOM'S TAXONOMY FOR CURRICULUM DESIGN AND ASSESSMENT:

Preamble

The design of curriculum and assessment is based on Bloom's Taxonomy. A comprehensive guideline for using Bloom's Taxonomy is given below for reference.

BIRLA INSTITUTE OF TECHNOLOGY

CHOICE BASED CREDIT SYSTEM (CBCS) CURRICULUM *(Effective from Academic Session: Monsoon 2018)*

PROGRAMME **2 Years Master of Science in Mathematics**

Department of Mathematics

Institute Vision

To become a Globally Recognized Academic Institution in consonance with the social, economic and ecological environment, striving continuously for excellence in education, research, and technological service to the National needs.

Institute Mission

- To educate students at Under Graduate, Post Graduate, Doctoral, and Post-Doctoral levels to perform challenging engineering and managerial jobs in industry.
- To provide excellent research and development facilities to take up Ph.D. programme and research projects.
- To develop effective teaching learning skills and state of art research potential of the faculty.
- To build national capabilities in technology, education, and research in emerging areas.
- To provide excellent technological services to satisfy the requirements of the industry and overall academic needs of society.

Department Vision

To become a globally recognized center of excellence in teaching and research, producing excellent academicians, professionals and innovators who can positively contribute towards the society.

Department Mission

- Imparting strong fundamental concepts to students in the field of Mathematical Sciences and motivate them towards innovative and emerging areas of research.
- Creation of compatible environment and provide sufficient research facilities for undertaking quality research to achieve global recognition.

Program Educational Objectives (PEOs)

1. To impart conceptual knowledge of Mathematical Sciences for formulating and analyzing the real world problems with futuristic approach.
2. To equip the students sufficiently in both analytical and computational skills in Mathematical Sciences.
3. To develop a competitive attitude for building a strong academic - industrial collaboration, with focus on continuous learning skills.
4. To nurture and nourish strong communication and interpersonal skills for working in a team with high moral and ethical values.

Programme Outcomes (POs)

A graduate of this program is expected to:

1. exhibit understanding of societal and environmental issues (health, legal, safety, cultural etc.) relevant to professional practice and demonstrate through actions, the need for sustainable development
2. be committed to professional ethics, responsibilities and economic, environmental, societal and political norms.
3. demonstrate appropriate inter-personal skills to function effectively as an individual, as a member or as a leader of a team and in a multi-disciplinary setting.
4. gain sound knowledge on fundamental principles and concepts of Mathematics with their applications related to Industrial, Engineering, Biological and Ecological problems.
5. exhibit in depth the analytical and critical thinking to identify, formulate and solve real world problems of science and engineering.
6. be proficient in arriving at innovative solution to a problem with due considerations to society and environment.

BLOOM'S TAXONOMY FOR CURRICULUM DESIGN AND ASSESSMENT:

Preamble

The design of curriculum and assessment is based on Bloom's Taxonomy. A comprehensive guideline for using Bloom's Taxonomy is given below for reference.

Details Syllabi for Choice Based Credit System of MSC
in
Mathematics

COURSE INFORMATION SHEET

Course code: MA 401

Course title: Real Analysis and Measure Theory

Pre-requisite(s): Basics of real analysis, Riemann Integration.

Co- requisite(s): ---

Credits: L: 3 T: 1 P: 0 C:4

Class schedule per week: 3 Lectures, 1 Tutorial.

Class: IMSc/ MSc

Semester / Level: VII / 4

Branch: Mathematics and Computing/Mathematics

Name of Teacher:

Course Objectives: This course enables the students to understand

1.	continuous functions and their bounded variation property
2.	Riemann Stieltjes Integration and their applications.
3.	difference between Riemann Integration and Riemann Stieltjes Integration of functions.
4.	the concept of Lebesgue integration and their applications, different theorems and their applications.
5	application of Fatou's lemma, Lebesgue dominated convergence theorem, Comparison of Lebesgue integral and Riemann integral.

Course Outcomes: After the completion of this course, students will be able to

CO1.	apply Riemann Stieltjes Integration on different boundary value problems
CO2.	apply Lebesgue theory and integration in the applications of qualitative theory of differential equations and difference equations.
CO3.	demonstrate a depth of understanding in advanced mathematical topics in relation to Biomathematics and engineering.
CO4	apply measure theory on functional analysis.
CO5	apply analysis on Topology.

Syllabus

MA401

Real Analysis and Measure Theory

3-1-0-4

Module I

Properties of Monotone functions, Functions of bounded variation along with their properties, Total variation, Functions of bounded variation expressed as the difference of increasing functions, Continuous function of bounded variation. Jordan's rectifiable curve theorem. [9L]

Module II

Definition Riemann-Stieltjes integral, Linear properties, Change of variable in a Riemann-Stieltjes integral, Necessary and Sufficient conditions for existence of Riemann-Stieltjes integral, Mean value theorem for Riemann-Stieltjes integral. [9L]

Module III

Borel Sets, σ -ring, σ -algebra, Lebesgue outer measure, measurable sets and their properties, Lebesgue measure, measurable function. [9L]

Module IV

Simple function and measurable function, Lebesgue integral of a non-negative measurable function using simple functions, Lebesgue integral of functions of arbitrary sign and basic properties (linearity and monotonicity). [9L]

Module V

Monotone convergence theorem and its consequences, Fatou's lemma, Lebesgue dominated convergence theorem, Comparison of Lebesgue integral and Riemann integral. [9L]

Text Book:

1. H. L. Royden and P. M. Fitzpatrick – Real Analysis, Pearson, Fourth edition, 2017.

COURSE INFORMATION SHEET

Course code: MA 402

Course title: Advanced Complex Analysis

Pre-requisite(s): Basics of Complex Variable Functions

Co- requisite(s): ---

Credits: L: 3 T: 1 P:0 C:4

Class schedule per week: 3 Lectures, 1 Tutorial.

Class: IMSc/MSc

Semester / Level: VII / 4

Branch: Mathematics and Computing/ Mathematics

Name of Teacher:

Course Objectives: This course enables the students to understand

1.	the complex differentiation and integration of analytic functions
2.	the convergence and divergence of series of complex variable functions, with special emphasis on Taylor and Laurent series
3.	the theory behind multivalued functions associated with complex variables
4.	the different properties associated with meromorphic functions
5.	convergence of infinite products of complex variable functions and their connection with zeros of entire functions

Course Outcomes : After the completion of this course, students will be able to

CO1	demonstrate the remarkable properties of complex variable functions, which are not the features of their real analogues
CO2	acquire knowledge about different types of functions viz. analytic, entire and meromorphic functions occur in complex analysis along with their properties
CO3	apply the knowledge of complex analysis in diverse fields related to mathematics
CO4	utilize the concepts of complex analysis to specific research problems in mathematics or other fields.
CO5	enhance and develop the ability of using the language of mathematics in analysing the real-world problems of sciences and engineering.

Syllabus

MA402

Advanced Complex Analysis

3-1-0-4

Module I

Topology of the complex plane, functions on the complex plane, Stereographic projection
Holomorphic (analytic) functions, Cauchy - Riemann equations, Integration of complex variable functions along curves, parameterization of curves, smooth curve, contours, contour Integrals and their properties, Cauchy - Goursat theorem, Cauchy – Integral Formula, Cauchy Integral Formula for derivatives, Cauchy's Inequality, Morera's theorem, Liouville's theorem. [10L]

Module II

Conformal mapping, fractional transformation, Riemann mapping theorem, Schwartz – Christoffel transformation
Convergence of Sequences and Series, Power series, absolute and uniform convergence of power series of complex functions, Integration and Differentiation of power series, Radius of convergence, Taylor series, Laurent series, Analytic continuation. [9L]

Module III

Zeros of analytic function, singularities of analytic function and their different types, Residues, Residue theorem. Multivalued functions, branch point, branch cut, evaluation of integrals involving branch point using calculus of residues. [9L]

Module IV

Meromorphic function and its properties, zeros and poles of meromorphic function, Riemann sphere, winding number, Argument principle, Rouché's theorem and its applications, Identity theorem, Schwarz's lemma, Maximum Modulus theorem, Fundamental theorem of algebra. [9L]

Module V

Infinite products, convergence of infinite products, Entire functions, Weierstrass primary factors, Weierstrass infinite product, Hadamard's factorization theorem, genus and order of entire function, growth of entire functions. Jensen's formula, functions of finite order. [8L]

COURSE INFORMATION SHEET

Course code: MA 420

Course title: Probability and Statistical Analysis

Pre-requisite(s): NIL

Co- requisite(s): NIL

Credits: L: 3 T: 1 P: 0 C:4

Class schedule per week: 3 Lectures 1 tutorial

Class: MSc

Semester / Level: I/ 4

Branch: Mathematics

Name of Teacher:

Course Objectives: This course enables the students to understand

1.	the concepts in probability theory
2.	the properties of probability distributions
3.	estimation of mean, variance and proportion
4.	the concepts of sampling techniques

Course Outcomes: After the completion of this course, students will be able to

CO1	learn basic probability axioms, rules and the moments of discrete and continuous random variables as well as be familiar with common named discrete and continuous random variables.
CO2	derive the distribution of function of random variables,
CO3	how to derive the marginal and conditional distributions of random variables.
CO4	find the point and interval estimates, derive confidence intervals and understand the methods of estimation
CO5	analyse data statistically and interpretation of the results

Module I

Axioms of probability, Probability space, Conditional probability, Independent events, Bayes' theorem, discrete and continuous random variables, nominal variable, ordinal variable, interval variable, matrix variable, cumulative distribution function, probability mass and density functions, mathematical expectation, variance, moment generating function. [9L]

Module II

Discrete and continuous probability distributions such as Bernoulli, Binomial, Negative Binomial, Geometric, hypergeometric, Poisson, Uniform, Exponential, Beta, Gamma and Normal distribution, distribution of function of random variable. Covariance, Correlation and regression Analysis. [9L]

Module III

Joint distribution for two dimensional random variables, marginal distributions, conditional distributions, conditional expectation, conditional variance, independence of random variables, distribution of sum of two independent random variables. The Central Limit Theorem, Weak and Strong Law of Large Numbers, t- distribution, Chi-Square Distribution, F- Distribution. [9L]

Module IV

Estimation: unbiasedness, consistency, efficiency, sufficiency, Minimum variance unbiased estimation, Minimum variance bound estimation, method of maximum likelihood, method of moments, minimum chi-square Testing of hypothesis, Neymann Pearson Lemma, Idea of Parametric and non-parametric tests, CR inequality, Rao-Blackwell theorem, Confidence interval, odds ratio, relative risk, standard error. [9L]

Module V

Sample size determination, Sampling Techniques: sampling and non-sampling errors, Simple Random Sampling with and without replacement, stratified random sampling, cluster sampling, systematic sampling, Quota sampling, Snowballing sampling, Purposive sampling. Design of experiments: Completely Randomized Design, Randomized Block design, Latin Square Design, Idea of factorial experiments. Applied Regression Analysis: Linear estimation under Gauss-Markoff setup. [9L]

COURSE INFORMATION SHEET

Course code: MA 422

Course title: Abstract Algebra

Pre-requisite(s): Basics of Set, Relation and Integers, fundamental theorem of equivalence relation, residue class of integers Z_n , Chinese Remainder Theorem, Euler ϕ -function, and inverse of a mapping.

Co-requisite(s): ---

Credits: L: 3 T: 0 P:0 C:3

Class schedule per week: 3 Lectures.

Class: MSc.

Semester / Level: I /4

Branch: Mathematics

Name of Teacher:

Course Objectives: This course enables the students to understand

1.	fundamental concept of abstract algebra which include axioms of a group structure, permutation groups, subgroups, cyclic groups, normal subgroup, quotient group, homomorphism, fundamental theorem of homomorphism, Cayley's theorem, correspondence theorem, direct product of groups.
2.	conjugacy classes, Cauchy's theorem, p-groups, Sylow's theorem, solvable group, finitely generated abelian group
3.	structure of a ring, integral domain, ideals and factor ring, ring homomorphism, polynomial ring, divisibility in integral domain, PID, UFD, ED
4.	vector space over a field and field structure, finite, algebraic and finitely generated field extension, splitting fields and normal extensions, Cyclotomic fields and introduction to Galois theory, solvability of polynomial by radicals.

Course Outcomes: After the completion of this course, students will be able to

CO1	Effectively write abstract mathematical proofs in a clear and logical manner and apply the theory of abstract algebra to specific research problems in mathematics or other fields.
CO2	Demonstrate ability to think critically by recognizing patterns (like in Mathematical Crystallography) and principles of algebra and relating them to the number system and analyze them from abstract point of view.
CO3	Gain an understanding to solve problems with the use of abstract algebra to diverse situations in mathematical contexts.
CO4	Use of ring theory and finite field to cryptography.
CO5	Handle problems related to vector space over a field and field structure

Module I

Introduction to Groups (Symmetric Group, Quaternion Group, Dihedral Group), Permutation Groups, Subgroups, Cyclic Groups, Cosets and Lagrange's Theorem, Normal subgroup, Quotient groups. Homomorphism's and Isomorphism's of Groups, Cayley's theorem, Correspondence theorem and its corollary. Direct products of Groups, internal direct product, external direct product. [8L]

Module II

Conjugacy classes, Cauchy's theorem and p-groups, Sylow's theorems and application. Solvable groups (subnormal series, normal series, composition series, Zassenhaus Lemma (statement only), Schreier theorem, Jordan holder theorem). Finitely generated abelian groups, fundamental theorem of finitely generated abelian group, invariant factors, elementary divisors. [8L]

Module III

Introduction to Rings (basic properties, characteristic of a ring, subrings, examples), Integral domains (the field of quotient of an Integral Domain), Ideals and Factor Rings (prime ideal and maximum ideals), Ring Homomorphism, Polynomial Rings, Factorization of polynomials (Reducibility tests, irreducibility test, UFD in $\mathbb{Z}[x]$), Divisibility in Integral Domains (prime and irreducible elements, PID, UFD, ED). [8L]

Module IV

Vector Space (Definition, Properties, Subspaces, Linear Independence, linear dependence, basis, dimension etc.). Introduction to Fields (Definition and some examples). Fields, Characteristic of a Field, Prime subfields Field extensions, Finite, algebraic and finitely generated field extensions, Splitting fields and normal extensions, algebraic closures. [8L]

Module V

Finite fields, Cyclotomic fields. An Introduction to Galois Theory: fundamental theorem of Galois Theory, Solvability of Polynomials by radicals, Insolvability of a Quintic. [8L]

Course title: Probability and Statistical Analysis Lab

Pre-requisite(s): NIL

Co- requisite(s): NIL

Credits: L: 0 T: 0 P: 3 C:1.5

Class schedule per week: 3 Practicals

Class: MSc

Semester / Level: I/4

Branch: Mathematics

Name of Teacher:

Course Objectives: This course enables the students to

1.	learn how to descriptive a given data by computing statistical summary measures
2.	learn how to fit suitable probability distributions to a given data
3.	learn to evaluate correlation coefficient and fit regression lines for a given data
4.	learn to test the normality of a given data
5.	learn several tests of significance

Course Outcomes: After the completion of this course, students will be able to

CO1	compute descriptive measures for a given data
CO2	fit suitable probability distributions to a given data
CO3.	compute correlation coefficient and fit regression lines for a given data
CO4	test the normality of a given data
CO5	perform suitable tests of significance as demanded by the problem

List of Practicals
(Using MS-EXCEL / SPSS / R)

1. Determination of Mean, Variance and Coefficient of Variation for a given set of observations.
2. Fitting of Binomial and Poisson distributions.
3. Fitting of a straight line to given data using Principle of Least Squares.
4. Calculation of correlation coefficients for bivariate data and interpretation of results.
5. Determination of two lines of regression for bivariate data.
6. Normality Test of data
7. Spearman's rank Correlation coefficient and Pearson's Correlation coefficient.
8. Testing of goodness of fit by applying Chi-Square Distribution.
9. Testing of independence of attributes by applying Chi-Square Distribution.
10. Interval estimation for Mean and Variance of a Normal Distribution.
11. Interval estimation for a Population Proportion.
12. Testing of single Mean and two Means.
13. Testing of single Variance and two Variances.
14. Testing of Population Proportion(s).

Course title: Topology

Pre-requisite(s): Basics of real Analysis and Functional Analysis

Co- requisite(s): ---

Credits: L: 3 T: 1 P: 0 C:4

Class schedule per week: 03 Lectures, 1 Tutorial

Class: IMSc/ MSc

Semester / Level: VIII/4

Branch: Mathematics and Computing/ Mathematics

Name of Teacher:

Course Objectives : This course enables the students to understand

1.	the concept of a Topological space which generalizes the spaces arising in Real and Functional Analysis
2.	the generalization of the concept of continuity on Topological spaces
3.	the connectedness and compactness of spaces through the concepts of topological properties.
4	generalization of different structure of spaces to Topological spaces
5	fundamental concepts of topology.

Course Outcomes: After the completion of this course, students will be able to

CO1.	understand the concept of topology in real world problems.
CO2.	applications of topological approach in the study of solutions of different boundary value problems using differential equations arising in Biological and Ecological systems and different engineering problems.
CO3.	applications of topological approach to study the qualitative properties of solutions of mathematical models arising in real world phenomena.
CO4.	applications of topological approach in the study of solutions of Difference Equations in different boundary value problems arising in Biological and Ecological systems and different engineering problems.
CO5.	use of topological concepts in Architecture Engineering.

Module I

Topological spaces: Definition and examples, Basis for a Topology, Standard Topology, Sub-basis. Product Topology: Definition, Projections, Subspace Topology, Closed sets and Limit points: closure and interior of a set, Hausdorff space, Continuity of a function on Topological Space [9L]

Module II

Metric Topology: Metrizable space, Euclidean metric, uniform topology, Subspaces, Uniform convergence of sequence of functions, Uniform limit theorem,

Connected spaces: Separation and connected space, union of connected sets, continuous image of connected spaces, Cartesian product of connected spaces, Path connected spaces: [9L]

Module - III

Countability and Separation Axioms: Countable basis, dense sets, separable space, Separable axioms: Hausdorff space, Regular space, Normal Space, Completely regular space, Urysohn's lemma, Tietze Extension theorem. [9L]

Module- IV

Compact Spaces: Cover, Open cover, Compactness: basic results and finite Intersection property, Compact subspaces of real line, uniformly continuous, uniform continuity theorem, Limit points and Compactness, Sequentially compact. [9L]

Module-V

Compactness in Metric Spaces: ε -net, Lebesgue number, equivalence of compactness, sequential compactness and limit point compactness in a metric space, uniform continuity theorem. [9L]

Course title: Advanced Operations Research

Pre-requisite(s): Optimization Techniques, Introductory statistics, linear algebra and calculus.

Co-requisite(s): -

Credits: L:3 T:1 P:0 C:4

Class schedule per week: 3 Lectures 1 tutorial

Class: IMSc /MSc

Semester: VIII / 4

Branch: Mathematics and Computing/Mathematics

Name of the Faculty:

Course Objectives: This course enables the students to understand

1.	dynamic programming concepts
2.	deterministic as well as stochastic inventory problems
3.	decision making problems under various decision-making environments
4.	performance measures of queuing systems
5.	non-linear programming concepts

Course Outcomes: After the completion of this course, students will be able to

CO1	conceptualize various dynamic programming models and their applications in solving multi-stage decision problems.
CO2	determine economic order quantity (EOQ) for minimizing total inventory cost, and handle inventory problems with probabilistic demand to determine EOQ.
CO3	make decision under various decision-making environments like certainty, risk and uncertainty; and determine strategies to win a game.
CO4	analyze various performance measures of queuing systems and derive those performance measures for single server and multiple server queuing models.
CO5	solve constrained optimization problems with equality as well as inequality constraints.

Syllabus

MA414

Advanced Operation Research

3-1-0-4

Module I

Dynamic Programming:

Introduction of Dynamic Programming, Deterministic Dynamic Programming: Forward and Backward Recursion, Selected DP Applications: Cargo load problem, Equipment Replacement Problem, Reliability problem. Solution of linear programming problem by dynamic programming. [9L]

Module II

Inventory Models:

Deterministic Inventory Models: General Inventory Models, Static EOQ models: classical EOQ model (EOQ without shortage), EOQ with shortage, EOQ with price breaks, multi-item EOQ with storage limitations. Dynamic EOQ models: No set-up model; set-up model. Stochastic Inventory Models: Probabilistic EOQ models; Single period models, Multi period models. [9L]

Module III

Decision Analysis and Games:

Decision making under certainty, Decision making under risk, Decision Tree Analysis, Utility theory, Decision making under uncertainty.

Game Theory: Optimal Solution of Two - person Zero-Sum games, Solution of mixed strategy games. [9L]

Module IV

Queuing Systems:

Queue, Elements of queuing model, Pure Birth and Death Models, Poisson Queuing systems: single server models- $\{(M/M/1):(\infty/FCFS)\}$, $\{(M/M/1):(N/FCFS)\}$, multiple server models- $\{(M/M/S):(\infty/FCFS)\}$, $\{(M/M/S):(N/FCFS)\}$, Non Poisson queuing system (Erlangian service time distribution). [9L]

Module V

Non-linear Programming:

Unconstrained Algorithm: Direct search Method and Gradient Method, Constraint Optimization with equality constraints (Lagrange's Multiplier Method), Constraint Optimization with inequality constraints (Kuhn Tucker Conditions), Quadratic Programming (Wolfe's Method), Separable Programming, Goal Programming. [9L]

Co-requisite(s): -

Credits: L:0 T:0 P:3 C:1.5

Class schedule per week: 3 Sessionals

Class: IMSc.

Semester/Level: VIII / 4

Branch: Mathematics and Computing

Course Coordinator:

Course Objectives: This course enables the students to understand

1.	dynamic programming concepts
2.	deterministic as well as stochastic inventory problems
3.	decision making problems under various decision - making environments
4.	performance measures of queuing systems
5.	non-linear programming concepts

Course Outcomes: After the completion of this course, students will be able to

CO1	conceptualize various dynamic programming models and their applications in solving multi-stage decision problems.
CO2	determine economic order quantity (EOQ) for minimizing total inventory cost, and handle inventory problems with probabilistic demand to determine EOQ.
CO3	make decision under various decision making environments like certainty, risk and uncertainty; and determine strategies to win a game.
CO4	analyze various performance measures of queuing systems and derive those performance measures for single server and multiple server queuing models.
CO5	solve constrained optimization problems with equality as well as inequality constraints.

List of Assignments

The following types of problems have to be solved by TORA, LINGO, Excel, or MATLAB as applicable:

1. Solution of shortest-route problems.
2. Solution of LPP using dynamic programming.
3. Computation of economic order quantity (EOQ) for deterministic inventory models.
4. Solution of decision - making problem under certainty – Analytical Hierarchy Process (AHP)
5. Solution of mixed strategy games by graphical method.
6. Solution of single server (M/M/1) and multiple server (M/M/S) queuing problems (Poisson queuing systems).
7. Solution of constraint optimization problems with equality constraints.
8. Solution of constraint optimization problems with inequality constraints.
9. Solution of goal programming problems.
10. Solution of quadratic programming problems.

COURSE INFORMATION SHEET

Course code: MA423

Course title: NUMERICAL ANALYSIS

Pre-requisite(s): NIL

Co- requisite(s): ---NIL

Credits: L: 3 T: 1 P: 0 C:4

Class schedule per week: 03 lectures, 1 tutorial

Class: MSc

Semester / Level: II/4

Branch: MATHEMATICS

Name of Teacher:

Course Objectives: This course enables the students to

1.	derive appropriate numerical methods to solve algebraic and transcendental equations.
2.	derive appropriate numerical methods to solve linear system of equations.
3.	approximate a function using various interpolation techniques.
4.	to find the numerical solution of initial value problems and boundary value problems.
5.	to find the numerical solution of partial differential equations.

Course Outcomes: After the completion of this course, students will be able to

CO1	solve algebraic and transcendental equation using an appropriate numerical method arising in various engineering problems.
CO2	solve linear system of equations using an appropriate numerical method arising in computer programming, chemical engineering problems etc.
CO3	evaluate derivative at a value using an appropriate numerical method in various research problems.
CO4	solve ordinary differential equation numerically.
CO5	solve partial differential equation numerically.

Module I

Numerical solution of and non-linear equations: root finding methods (Newton's and fixed point methods). Iterative methods for complex roots and roots of nonlinear systems of equations.

[6L]

Module II

Numerical solutions of linear systems of equations using direct (Gauss-Elimination, Gauss-Jordan, LU-Decomposition, Cholesky) and iterative methods (Gauss-Jacobi, Gauss-Seidel and SOR methods). Error analysis for direct method and convergence analysis of iterative methods. Condition number and ill- conditioned of systems. Eigen Values and Eigen vectors, Bounds on Eigen values, Rayleigh quotient method, Jacobi, Given and Householder's methods for symmetric matrices, Power method, Inverse Power method.

[12L]

Module III

Lagrange and Newton's interpolation, interpolating polynomials using finite differences, Hermit interpolation, Piecewise and Spline interpolation, errors in interpolation. Function approximations using least square and uniform approximations. Differentiation using interpolation formulas, integration using methods based on interpolation (Trapezoidal rule, Simpson's 1/3, 3/8 rule, Weddle's rule) and undetermined coefficients (Trapezoidal rule, Simpson's 1/3, 3/8 rule, Weddle's rule).

[9L]

Module IV

Initial value problems: Single step methods, stability analysis of single step methods, multistep methods, stability analysis of multistep methods. Boundary value problems: Shooting and finite difference methods.

[9L]

Module V

Finite difference approximations to partial derivatives, solution of Laplace and Poisson's equations using standard five-point formula and diagonal five-point formula, solution of one dimensional heat conduction equation by Bender-Schmidt method and Crank-Nicolson method, solution of wave equation, stability of finite difference schemes for parabolic and hyperbolic equations.

COURSE INFORMATION SHEET

Course code: MA 424

Course title: Numerical Analysis Lab

Pre-requisite(s): NIL

Co- requisite(s): ---NIL

Credits: L: 0 T: 0 P: 3 C:1.5

Class schedule per week: 3 Practicals

Class: MSc

Semester / Level: II/4

Branch: Mathematics

Name of Teacher:

Course Objectives: This course enables the students to

1.	execute appropriate numerical methods to solve algebraic and transcendental equations correct up to some certain level of significance
2.	solve linear system of homogenous and non - homogeneous equations in computer
3.	approximate a function by polynomial using various interpolation techniques
4.	compute numerical solution of initial value problems and boundary value problems
5.	handle numerical problems efficiently by programming language like C, C++ on computer

Course Outcomes: After the completion of this course, students will be able to

CO1	solve algebraic and transcendental equation using an appropriate numerical method arising in various engineering problems efficiently
CO2	solve linear system of equations using an appropriate numerical method arising in computer programming, chemical engineering problems etc. efficiently
CO3.	Approximate a function using an appropriate numerical method in various research problems up to desired level of accuracy
CO4	evaluate definite integral using an appropriate numerical method in various practical problems
CO5	Solve different types of differential equations numerically

List of Practicals

1. Find a simple root of $f(x) = 0$ using bisection method and Regula Falsi method. Read the end points of the interval (a, b) in which the root lies, maximum number of iterations n and error tolerance eps.
2. Find a simple root of $f(x) = 0$ using Newton Raphson method. Read any initial approximation x_0 , maximum number of iterations n and error tolerance eps.
3. Solution of a system of $n \times n$ linear equations using Gauss elimination method with partial pivoting. The program is for 10×10 system. Change the dimension if higher order system is to be solved.
4. Matrix inversion and solution of $n \times n$ system of equations using Gauss-Jordan method. If the system of equations is larger than 15×15 change the dimensions of the float statement.
5. Program to solve a system of equation using Gauss-Seidel iteration method. Order of the matrix is n , maximum number of iterations $niter$, error tolerance is eps and the initial approximation to the solution vector is x_0 . If the system of equations is larger than 10×10 change the dimension in float.
6. Program to find the largest Eigen value in magnitude and the corresponding Eigen vector of a square matrix A of order n using power method.
7. Program for Lagrange interpolation, Newton divided difference interpolation and Newton's forward and backward interpolation.
8. Program to evaluate the integral of $f(x)$ between the limits a to b using Trapezoidal rule of integration based on n subintervals or $n + 1$ nodal points. The values of a, b and n are to be read. The program is tested for $f(x) = 1 / (1 + x)$.
9. Program to evaluate the integral of $f(x)$ between the limits a to b using Simpson's rule of integration based on $2n$ subintervals or $2n + 1$ nodal points. The values of a, b and n are to be read and the integrand is written as a function subprogram. The program is tested for $f(x) = 1 / (1 + x)$.
10. Program to solve an IVP, $\frac{dy}{dx} = f(x, y), y(x_0) = y_0$ using Euler method. The initial value x_0, y_0 the final value x_f and the step size h are to be read. The program is tested for $f(x, y) = -2xy^2$.
11. Program to solve an IVP, $\frac{dy}{dx} = f(x, y), y(x_0) = y_0$ using the classical Runge-Kutta fourth order method with step size $h, h/2$ and also computes the estimate of the truncation error. Input parameters are: initial point, initial value, number of intervals and the step length h . Solutions with $h, h/2$ and the estimate of the truncation error are available as output. The right hand side The program is tested for $f(x, y) = -2xy^2$.
12. Write a program to solve Boundary value problem using an appropriate numerical method.
13. Write a program to solve Heat, Wave and Laplace equation using an appropriate numerical method.

COURSE INFORMATION SHEET

Course code: MA 425

Course title: Fluid Dynamics

Pre-requisite(s): Vector Analysis, Complex Analysis, Differential Equations.

Co- requisite(s):

Credits: L: 3 T: 0 P: 0 C: 3

Class schedule per week: 3 Lectures.

Class: M.Sc.

Semester / Level: II/4

Branch: Mathematics

Name of Teacher:

Course Objectives: This course enables the students:

1.	to understand the fundamentals of fluid motion.
2.	to equip them with fundamental knowledge of fluids, its properties and behavior under various kinds of flow.
3.	to assess the validity of Bernoulli's Equation for various fluid systems.
4.	to acquire the skills of dimensionless numbers and their analysis.
5.	to apply the applications of Navier – Stokes equation in different areas.

Course Outcomes: After the completion of this course, students will be able to :

CO1	demonstrate the applicability of fluid motions under diverse situations.
CO2	formulate real world fluid problems in terms of mathematical terms.
CO3	determine analytical solutions of fluid problems and their physical interpretation.
CO4	inculcate the importance of fluid flow measurements and their applications in research and development.
CO5	appreciate how abstract ideas in fluid dynamics can be applied to practical problems.

Module-I

Basics of Fluid Motion: Continuum Hypothesis, Properties of fluids, Types of fluids, Classification of flow Phenomena.

Eulerian and Lagrangian approaches, Velocity of fluid Particle, Substantial (Particle or Material) and Local Derivative, Streamlines, Path lines and Streak lines, Acceleration of Fluid, Angular velocity, Velocity potential, Vorticity vector. [8L]

Module-II

Conservation of mass, Equation of continuity in different coordinate systems.

Inviscid Fluids, Euler's equation of motion, Bernoulli's equation, Cauchy's Integrals. [8L]

Module-III

Two - dimensional flow, Stream function & its significance, Singularities of flow, Source, Sink, Doublets, Rectilinear vortices, Complex variable method for two-dimensional problems. [8L]

Module-IV

Complex potentials for various singularities, Circle theorem, Blasius theorem, Theory of images and its applications to various singularities. [8L]

Module-V

Dimensional analysis and its different techniques, Dimensional homogeneity, Reynold's number, Navier - Stokes equations, Couette flow, Poiseuille flow. Introduction to boundary layer theory. [8L]

Course title: Functional Analysis

Pre-requisite(s): Basics of Real Analysis and Linear Algebra

Co- requisite(s): ---

Credits: L: 3 T: 1 P: 0 C:4

Class schedule per week: 3 Lectures, 1 Tutorials

Class: IMSc/MSc

Semester / Level: IX/5

Branch: Mathematics and Computing/Mathematics

Name of Teacher:

Course Objectives: This course enables the students to understand

1.	extension of concepts of Real analysis and Linear Algebra
2.	different Linear Spaces and their applications
3.	extension of Eigen values and Eigen functions in Banach Spaces and Hilbert spaces.
4.	concepts of Bounded Linear operators on Hilbert spaces
5	concepts on Hilbert Space

Course Outcomes: After the completion of this course, students will be able to

CO1.	apply the theory of functional analysis in the qualitative study of different mathematical models in Biological and Ecological systems and different engineering problems.
CO2.	this will help the students to study the stability theory of Differential equations and difference equations
CO3	understand the concept of topology in real world problems.
CO4.	applications of topological approach in the study of solutions of Difference Equations in different boundary value problems arising in Biological and Ecological systems and different engineering problems.
CO5	use of topological concepts in Architecture Engineering.

Syllabus
Functional Analysis

MA501

3-1-0-4

Module I

Preliminaries: Relation on a set, function, equivalence relation, partial order relation, partial order set, maximal, totally ordered set, Zorn's lemma, Axiom of choice.

Introduction to linear spaces, linear maps, convex, span of a set, linearly dependent and independent set, finite and infinite dimensional linear spaces, quotient spaces, linear map, zero space, null space, zero map, linear functional, hyperspace, hyperplane.

Metric space and continuous functions: Definition and examples, Holder inequality, Minkowski inequality, open sets, separable metric spaces, Cauchy sequence, complete metric space, Baire theorem, Compactness, Heine-Borel theorem, Continuity of functions, Uryshon's lemma, Tietze's Extension theorem, Ascoli's theorem. [10L]

Module II

Normed Linear Space: Normed linear spaces over $\mathbb{R}$ and $\mathbb{C}$, Definitions and examples including N/M where M is a closed subspace of N and $\|x+M\| = \inf\{\|x+M\|: x \in M\}$. With normed linear spaces N and N' over same scalars: $N \rightarrow N'$ continuous bounded linear maps and equivalent formulations of continuous linear maps. Norm in $B(N, N')$ and equivalent descriptions. N^* (dual of N) and functionals on N , equivalence of norms, special features of finite dimensional normed linear spaces, convexity, Riesz lemma, Hahn-Banach extension theorem and its applications, Natural embedding of N and N^* , to find l_p^* , C_0^* and $C^*[0,1]$. [10L]

Module III

Banach Space: Definition and examples together with N/M and $B(N, N')$, Open mapping theorem, Projection on Banach space, closed Graph theorem, Uniform bounded theorem, conjugate of an operator on a normed linear space, Properties of $T \rightarrow T^*$ maps. [7L]

Module IV

Hilbert spaces: Inner product spaces, Polarization identity, Jordan Von-Neumann theorem, Parallelogram law, Schwarz's inequality. Hilbert space, orthonormal set, Pythagoras theorem, The Gram-Schmidt orthogonalization theorem, Bessel inequality, Orthonormal basis, Fourier expansion and Parseval's formulae.

Projection theorem, Riesz Representation theorem, unique Hahn-Banach extension theorem. [8L]

Module V

Operators on a Hilbert space : Adjoint of an operator on a Hilbert space (existence and uniqueness), properties of Adjoint, Self Adjoint operator and its characteristics and positive operator, real and imaginary parts of an operator: Normal operator and Unitary operator together with their characterization, Projection operator, Invariance and Reducibility, Orthogonal projections and sum of projections on closed subspaces of H , Matrix of an operator on a finite dimensional H , Spectral theorem for finite dimensional H . [10L]

Class: IMSc.

Semester / Level: IX / 5

Branch: Mathematics and Computing

Name of Teacher:

Course Objectives : This course enables the students to

1.	identify and apply various properties of integers including factorization, the division algorithm, and greatest common divisors. This course also enables students to identify certain number theoretic functions and their properties.
2.	understand the concept of a congruence, Chinese Remainder Theorem, Euler's Theorem, Fermat's Theorem. It also enables students to solve certain types of Diophantine equations, Pell's equation and its relation to continued fraction
3.	understand the concept of primitive roots for primes, Legendre Symbol, Jacobi Symbol
4.	identify how number theory is related to cryptography

Course Outcomes: After the completion of this course, students will be able to

CO1	apply the number theory to specific research problems in mathematics or in other fields.
CO2	Use Fermat's, Euler's and Chinese remainder theorems to solve congruence equations arise in various research problems
CO3	solve Pell's equation with the use of continued fraction, and learn how to find primitive roots
CO4	use Primality test and factorization algorithm to factor large composite numbers.
CO5	learn how to apply number theory in various research problems arising in cryptography.

Syllabus
Number Theory

MA502

3-1-0-4

Module I

Divisibility: basic definition, properties, prime numbers, some results on distribution of primes, Division algorithm, greatest common divisor, Euclid's Lemma, Euclidean Algorithm, fundamental theorem of arithmetic, the greatest common divisor of more than two numbers. Arithmetic functions and properties: Mobius function $\mu(n)$, Euler's totient function $\phi(n)$, $\sigma(n)$, $\tau(n)$, $d(n)$ Mobius inversion formula. [9L]

Module II

Congruences: Definitions and basic properties, residue classes, Reduced residue classes, complete and Reduced residue systems, Fermat's little Theorem, Euler's Theorem, Wilson's Theorem, Algebraic congruences and roots. Linear congruences, Chinese Remainder theorem and its applications. Polynomial congruences: Meaning of "divisor" modulo n , root and divisor. Theorem of Lagrange on polynomial congruence modulo p . Application of Taylor's series for polynomial congruence modulo prime power. Primitive roots: A property of reduced residue system belonging to an exponent modulo m , primitive roots, existence and number of primitive roots of a prime. [10L]

Module III

Quadratic Number fields: Integers, Units, Primes and irreducible elements, Failure of unique factorization, simple continued fractions: finite and infinite, linear Diophantine equations, Pell's equation via simple continued fraction. [9L]

Module IV

Primality Testing and factorization algorithms, Pseudo-primes, Fermat's pseudo-primes, Pollard's rho method for factorization. Euler's criterion, quadratic residue, Legendre and Jacobi Symbol and their properties, Evaluation of $(-1/p)$ and $(2/p)$, Gauss's Lemma, Quadratic reciprocity law. [9L]

Module V

Public Key cryptography, Diffie-Hellmann key exchange, Discrete logarithm-based cryptosystems, RSA crypto-system, Rabin crypto-system, Knapsack crypto-system, Paillier crypto-system, Introduction to elliptic curves: Group structure, Rational points on elliptic curves, Elliptic Curve Cryptography: applications in cryptography and factorization. [8L]

Course title: Advanced Differential Equations

Pre-requisite(s): Ordinary and partial differential equations

Co- requisite(s): ---

Credits: L: 3 T: 0 P:0 C:3

Class schedule per week: 3 lectures.

Class: M. Sc

Semester / Level: III / PG

Branch: Mathematics

Name of Teacher:

Course Objectives: This course enables the students to understand

1.	existence and uniqueness theorem for first order ODEs, stability, adjoint and self-adjoint differential equations, Sturm-Liouville problem,
2.	non-linear partial differential equations, Charpit's and Jacobi's methods, Cauchy's method of characteristics, Higher order linear partial differential equations with constant coefficients,
3.	classification and canonical transformation of second order linear partial differential equations. Method of separation of variables for solving hyperbolic, parabolic.
4.	Dirichlet, Neumann, Cauchy boundary conditions. Dirichlet and Neumann problems for a rectangle, theory of Green's function for Laplace equation.

Course Outcomes: After the completion of this course, students will be able to

CO1	solve differential equation problems in the field of Industrial Organisation Engineering.
CO2	competence in solving applied linear and nonlinear problems
CO3	solve the problems choosing the most suitable method
CO4	solve the partial differential equations with boundary conditions and initial conditions
CO5	handle Dirichlet, Neumann, Cauchy boundary conditions and solve Dirichlet and Neumann problems for a rectangle, theory of Green's function for Laplace equation.

Syllabus

MA510

Advanced Differential Equations

3-0-0-3

Module I

Existence and uniqueness of solution of initial value problems for first order ODEs, singular solutions of first order ODEs, system of first order ODEs. Introduction, definition of stability, linear systems, almost linear systems, conditional stability. Adjoint and Self-Adjoint differential equations, Sturm-Liouville problem, eigenvalues and eigenfunctions, singular Sturm-Liouville problem, orthogonality of eigenfunctions and eigenfunctions expansion. **[8L]**

Module II

Non-linear partial differential equations, compatible system of first order equations, Charpit's and Jacobi's methods, Cauchy's method of characteristics. Classification and canonical transformation of second order linear partial differential equations. **[8L]**

Module III

Method of separation of variables for linear partial differential equations; Hyperbolic Equations: D'Alembert's solution, vibrations of an infinite string and a semi-infinite string. Vibrations of string of finite length (separation method), Riemann's method. **[8L]**

Module IV

Parabolic Equations: Method of separation of variables: heat equation, heat conduction problem for an infinite rod, a finite rod, Duhamel's principle for parabolic equations. **[8L]**

Module V

Elliptic Equations: Boundary value problems: Dirichlet's, Neumann, Cauchy boundary conditions. Maximum and minimum principles, Dirichlet's and Neumann problems for a rectangle (separation of variables), theory of Green's function for Laplace equation. **[8L]**

COURSE INFORMATION SHEET

Course code: MA 405

Course title: Mathematical Modeling

Pre-requisite(s): MA 106, MA 201, MA301, MA311

Credits: L:3 T:0 P:0 C:3

Class schedule per week: 3 lectures

Class: IMSc/ MSc

Semester/level: VII / 4

Branch: Mathematics and Computing/ Mathematics

Name of the Faculty:

Course Objectives: This course enables the students to get the detailed idea about:

1.	models, properties of models, model classification and characterization, steps in building mathematical models.
2.	analytic methods of model fitting
3.	discrete Probabilistic Modeling
4.	modeling with a Differential Equations
5	simulation Modeling – Discrete-Event Simulation, Continuous Simulation, Monte-Carlo simulation

Course Outcomes: After completion of the course, the learners will be able to:

CO1.	learn different approach of mathematical modelling
CO2	perform a task of model fitting using different mathematical methods in least expensive ways.
CO3.	get an understanding of solving and validating proposed mathematical models with different physical behavior of the problems.
CO4.	apply the principles of mathematical modelling to solve a variety of practical problems in sciences and engineering.
CO5.	equip the students with standard concepts and tools at an intermediate to advanced level that will serve them well towards tackling more advanced level of mathematics

Module I

Introduction Models, reality, Properties of models, model classification and characterization, steps in building mathematical models, sources of errors, dimensional analysis. Modeling using Proportionality, Modeling using Geometric similarity; graphs of a functions as models. [8L]

Module II

Model Fitting – Fitting models to data graphically, Analytic methods of model fitting, Applying the least square criterion, Experimental Modeling – High order polynomial models, Cubic Spline models. [8L]

Module III

Discrete Probabilistic Modeling –Probabilistic modeling with discrete system; Modeling components & System Reliability; Linear Regression. Discrete Optimization Modeling – Linear Programming – Geometric solutions, Algebraic Solutions, Simplex Method and Sensitivity Analysis [8L]

Module IV

Modeling with a Differential Equations – Population Growth, Graphical solutions of autonomous differential equations, numerical approximation methods-- Euler's Method and R.K. Method. Modeling with systems of Differential Equations – Predator Prey Model, Epidemic models, Euler's method for systems of Differential equations. [8L]

Module V

Simulation Modeling – Discrete-Event Simulation, Generating random numbers; Simulating probabilistic behavior; Simulation of Inventory model and Queueing Models using C program. Other Types of simulation—Continuous Simulation, Monte-Carlo simulation. Advantages, disadvantages and pitfalls of simulation Case Study: Case Studies for various aspects of Modeling to be done. [8L]

COURSE INFORMATION SHEET

Course code: MA406

Course title: Fuzzy Mathematical Programming

Pre-requisite(s): MA314

Credits: L:3 T:0 P:0 C:3

Class schedule per week: 3 lectures

Class: IMSc /MSc

Semester: VII/ 4

Branch: Mathematics and Computing/ Mathematics

Course Coordinator:

Course Objectives:

1	Fuzzy Set Theory: Basic terminology and definition. Membership Function. Examples to generate membership functions. Distance approach, True- valued approach, payoff function.
2	Fuzzy Decision and Fuzzy Operators. Fuzzy Arithmetic: Addition of Fuzzy Numbers, Subtraction of Fuzzy Numbers, Multiplication of Fuzzy Numbers, Division of Fuzzy Numbers, Triangular and Trapezoidal Fuzzy Numbers. Fuzzy Linear programming Models: Linear Programming Problem with Fuzzy Resources: Verdegay's Approach. Werner's approach..
3	Linear Programming with Fuzzy Resources and objective. Zimmermann's Approach.. A regional resource allocation problem. Chana's Approach. An optimal system design Problem.
4	Linear Programming with Fuzzy parameters in the objective function. Interactive Fuzzy Linear Programming, Introduction, Discussion of zimmermann's, Werners'sChanas's and Verdegay's Approaches. Interactive Fuzzy Linear Programming - I. Problem Setting The Algorithm of IFLP-I. Interactive Fuzzy Linear Programming - II.The Algorithm of IFLP-II
5	Linear Programming with Imprecise Coefficients. Linear Programming with Imprecise Objective. Coefficients and Fuzzy Resources.

Course Outcomes: After the completion of the course, the students will be able to:

CO1	learn about various terminologies important in fuzzy mathematical programming.
CO2	learn about Fuzzy Decision and Fuzzy Operators in fuzzy mathematical programming.
CO3	learn about Linear Programming with Fuzzy Resources and objective
CO4	learn Linear Programming with Fuzzy parameters in the objective function
CO5	learn about Linear Programming with Imprecise Coefficients.

Syllabus

MA 406

FUZZY MATHEMATICAL PROGRAMMING

3-0-0-3

MODULE I:

Fuzzy Set Theory: Basic Terminology and Definition. Support, α -level set, normality, convexity and Concavity, Extension Principle, Compatibility of extension principle with α -cuts, relation, Decomposability, Decomposition Theorem. Basic Fuzzy operations: Inclusion, Equality, Complementation, Intersection, union, Algebraic Product, Algebraic Sum, Difference. Membership Function. A survey of functional forms. Examples to generate membership functions.: Distance approach, True-valued approach, payoff function. [8L]

MODULE II

Fuzzy Decision and Fuzzy Operators: Fuzzy Decision, Max-Min operator, compensatory operators. Fuzzy Arithmetic: Addition of Fuzzy Numbers, Subtraction of Fuzzy Numbers, Multiplication of Fuzzy Numbers, Division of Fuzzy Numbers, Triangular and Trapezoidal Fuzzy Numbers. Fuzzy Linear programming Models: Linear Programming Problem with Fuzzy Resources: Verdegay's Approach. The Knox Production Mix selection Problem. A transportation Problem. Werner's approach. The Knox Production-Mix selection Problem. An Air Pollution Regulation Problem. [8L]

MODULE III:

Linear Programming with Fuzzy Resources and objective. Zimmermann's Approach. The Knox Production-Mix Selection Problem. A regional resource allocation problem. Chana's Approach. An optimal system design Problem. An aggregate Production Planning Problem. [8L]

MODULE IV:

Linear Programming with Fuzzy parameters in the objective function. Linear Programming with all fuzzy coefficients. A Production scheduling problem. Interactive Fuzzy Linear Programming, Introduction, Discussion of Zimmermann's, Werner's, Chana's and Verdegay's Approaches. Interactive Fuzzy Linear Programming - I. Problem Setting The Algorithm of IFLP-I. Example: The Knox Production-Mix. Selection Problem. Interactive Fuzzy Linear Programming - II. The Algorithm of IFLP-II. [8L]

MODULE V:

Linear Programming with Imprecise Coefficients. Lai and Hwang's Approach. Buckley's Approach. Example: A Feed Mix (Diet) Problem. Negi's Approach. Fuller's Approach. Other Problems. Linear Programming with Imprecise Objective. Coefficients and Fuzzy Resources. Example: A Bank Hedging Decision Problem. [8L]

COURSE INFORMATION SHEET

Course code: MA407

Course title: Survey Sampling

Pre-requisite(s): Basics of Probability and Statistics

Credits: L:3 T:0 P:0 C:3

Class schedule per week: 3 lectures

Class: IMSc/MSc

Semester/level: VII / 4

Branch: Mathematics and Computing/ Mathematics

Name of the Faculty:

Course Objectives: This course will enable the students to understand:

1.	sampling unit, Sampling frame and Sampling design, along with the various methods of primary data collection
2.	sampling and Non-sampling errors
3.	simple Random Sampling, Stratified Sampling, and various others Probability Sampling Designs
4.	methods of Estimation of Population Parameters (such as Population Mean and Population Variance)
5.	two-phase (or Double) Sampling and estimation of optimum sample sizes using Cost Function Analysis
6.	probability Proportional to Size (PPS) sampling, Midzuno Sampling design, Ordered and unordered estimators

Course Outcomes: After completion of the course, the students will be able to:

CO1	differentiate between Sampling and Non-sampling errors.
CO2	gain an understanding of various methods of primary data collection.
CO3	gain an understanding of various Probability Sampling Designs.
CO4	describe the various procedures for Estimation of Population Parameters (such as Population Mean and Population Variance).
CO5	gain an understanding of Two-phase Sampling and demonstrate the procedure for estimation of optimum sample sizes using Cost Function Analysis.

Module I

Concept of Population and Sample, Primary and Secondary data, Methods of Collecting Primary data, Sampling unit, Sampling frame, Sampling design, Census and Sample Surveys, Sampling and Non-sampling errors. [8L]

Module II

Simple Random Sampling, Stratified Sampling, Advantages of Stratification, Allocation of sample size in different strata, Systematic Sampling, Cluster Sampling, Two-stage sampling. [8L]

Module III

Concept of Study variable and Auxiliary variable, Estimation of population mean and variance using Ratio, Product and Regression Methods of Estimation, Methods for obtaining unbiased estimators. [8L]

Module IV

Concept of Two-phase (or Double) Sampling, Double Sampling for Ratio and Regression Estimators, Cost function Analysis. [8L]

Module V

Probability Proportional to Size (PPS) sampling, Inclusion Probabilities, Horvitz-Thompson estimator, Yates-Grundy form, Midzuno Sampling design, Ordered and Unordered estimators. [8L]

COURSE INFORMATION SHEET

Course code: MA 408

Course title: Theory of Elasticity

Pre-requisite(s): NIL

Co- requisite(s):

Credits: L: 3 T: 0 P: 0 C:3

Class schedule per week: 3 Lectures

Class: IMSc/ MSc

Semester / Level: VII / 4

Branch: Mathematics and Computing/Mathematics

Name of Teacher:

Course Objectives: This course enables the students to understand:

1.	the classical theory of linear elasticity for two and three-dimensional state of stress, Tensorial character of stress.
2.	the solutions for selected problems of Elasticity in rectangular and polar coordinate as well as torsion of prismatic bars.
3.	the plane problems, Problems of axi-symmetric stress distribution; Problems in Polar coordinates-simple radial stress distribution and problems on wedges.
4.	the semi-inverse and inverse methods, Torsion of non-circular sections, Strain energy method-strain energy density, and Complex variable technique: complex stress functions.

Course Outcomes : After the completion of this course, students will be able to:

CO1	analyse the motion of particles in elastic medium.
CO2	understand the deformation of elastic body.
CO3	determine the motion of elastic body in different coordinates system.
CO4	to find the solution of some engineering problem like strips, beams, membrane and plate problems.
CO5	demonstrate a depth of understanding in advanced mathematical topics, which will serve them well towards tackling real world problems of science and engineering.

Module I

Stress and Strain components at a point; Equations of equilibrium; Stress-Strain relationships, Generalized Hooke's Law; Strain compatibility relations; Boundary conditions; Uniqueness theorem and Superposition principles; other theorems-double suffix notation is adopted. [8L]

Module II

Transformation of stress and strain at a point, their tensorial character; characteristic equations of stress and strain tensors and invariants- octahedral shear stress. [8L]

Module III

Plane problems of elasticity in rectangular and polar coordinates-stress function approach; Solution by Polynomials; Displacements in simple cases; Problems of Axi-symmetric stress distribution; Problems in Polar coordinates-simple radial stress distribution and problems on wedges. [8L]

Module IV

Semi-inverse and inverse methods; Torsion of non-circular sections. Strain energy method – strain energy density; Variational principle. Applications to strips, beams, membrane and plate problems. [8L]

Module V

Complex variable technique-complex stress functions, stresses and displacements in terms of complex potentials, boundary conditions. [8L]

Text Books:

1. Timoshenko S., Theory of Elasticity, McGraw-Hill Companies, (1970).
2. Timoshenko S. and Goodier J.N., Theory of Elasticity, McGraw-Hill, Inc., New York, (1951).

COURSE INFORMATION SHEET

Course code: MA 410

Course title: Differential Geometry

Pre-requisite(s): Vector Analysis

Co- requisite(s): ---

Credits: L: 3 T: 0 P: 0 C:3

Class schedule per week: 3 Lectures

Class: MSc

Semester / Level: I/4

Branch: Mathematics and Computing/Mathematics

Name of Teacher:

Course Objectives: This course enables the students to understand

1.	differential geometry of curves, their fundamental properties like torsion, curvature etc. along with their different forms
2.	differential geometry of surfaces, their different properties, along with their different forms
3.	curvilinear coordinates on a surface and fundamental magnitudes on a surface
4.	different forms of curves and surfaces, along with their diverse properties through the use of differential calculus

Course Outcomes: After the completion of this course, students will be able to

CO1.	develop different properties associated with curves and surfaces
CO2	use differential forms to perform calculus on curves and surfaces
CO3.	apply the theory of differential geometry to specific research problems in mathematics or other fields.
CO4.	gain an understanding to solve problems with the use of differential geometry to diverse situations in mathematical contexts
CO5.	demonstrate a depth of understanding in advanced mathematical topics in relation to geometry of curves and surfaces

A) Geometry of Curves**Module I**

Curves, curves in n - dimensional space with examples, plane curve, space curve, properties of plane curve and space curve, arc-length, parameterization of curves, regular curve, tangent, principal normal, binormal, curvature, torsion, screw curvature, TNB frame, fundamental planes, Serret-Frenet formulae. [8L]

Module II

Intrinsic equations, existence and uniqueness theorems, contact between curves and surfaces, osculating plane, Locus of centre of curvature, spherical curvature, osculating sphere, spherical indicatrix of tangent, normal and binormal, involutes, evolutes, Bertrand curves. [8L]

B) Geometry of Surfaces**Module III**

Surfaces, different forms of surfaces, smooth surface, tangent plane, normal line.

Length of curves on surfaces, curvilinear coordinates on a surface, parametric curves on a surface, first fundamental form, first order magnitudes. [8L]

Module IV

Normal to the surface, second Fundamental form, second order magnitudes.

Derivatives of normal to the surface, Weingarten Relations, curvature of normal section, principal and normal curvature, Meunier's theorem, mean curvature, Gauss curvature, lines of curvature, Rodrigue's formula, Euler's theorem. [8L]

Module V

Gauss formulae, Gauss characteristic equation, Mainardi – Codazzi equations. Introduction to geodesics on surfaces, equations of geodesics [8L]

COURSE INFORMATION SHEET

Course code: MA 430

Course title: Discrete Mathematical Structure

Pre-requisite(s):

Co- requisite(s):

Credits: 4 L:3 T:1 P:0

Class schedule per week: 03

Class: MSc/MCA

Semester / Level: I/4

Branch: Mathematics/ MCA

Name of Teacher:

Course Objectives: This course enables the students:

1.	apply mathematical proof of logical statements
2.	learn designing and solving recurrence relation
3.	apply the concept of algebraic structure in relation with computer science
4.	understand graph terminologies and their representation

Course Outcomes: After the completion of this course, students will be able to:

CO1.	learn a number of techniques to model and solve problems in mathematical ways
CO2.	apply mathematical logic and reasoning to solve real time problems
CO3.	understand the relation between graph theory and real world problems
CO4.	develop logical thinking and its application to computer science
CO5.	to understand the concepts in graph theory and would able to apply in real world problems

Module-I

Introduction: Sets - Finite and Infinite sets, Functions, Relations, Properties of Binary Relations, Representation of relation, Closure operations, Equivalence and Partial order relations; Pigeonhole Principle, Permutation and Combination; Mathematical Induction, Principle of Inclusion and Exclusion. **[8L]**

Module-II:

Functions and its properties, asymptotic notations and growth of functions recurrences: Recurrence Relations, solving the recurrence relation with constant coefficients, solving the recurrence relation by using Generating functions **[8L]**

Module-III: Group: Semi group, Group, Finite and infinite groups, Sub-groups, Cosets, Lagrange's Theorem, Ring and Field, Vector, Vector space and subspace, Linear combination of vectors, Basis. Coding: Codewords and code, Encoding and decoding function, Hamming distance, Error detection and correction of codes **[8L]**

Module-IV and V: Graph Theory: Basic Terminology, Types of graphs, Graph Representation, Graph Isomorphism, Connectivity, Euler and Hamiltonian graphs, Planar Graphs, Graph Coloring, Chromatic number and chromatic polynomial

Trees: Basic Terminologies and properties of Trees, Introduction to Spanning Trees, Minimum spanning trees.

Propositional Logic: Proposition, Logical operation and its properties, Tautologies, Equivalences.

COURSE INFORMATION SHEET

Course code: MA 416

Course title: Statistical Inference

Pre-requisite(s): Basics of Probability and Statistics

Credits: L:3 T:0 P:0 C: 3

Class schedule per week: 3 lectures

Class: IMSc/MSc

Semester/level: VIII/4

Branch: Mathematics and Computing/ Mathematics

Name of the Faculty:

Course Objectives: This course will enable the students to understand:

1.	point Estimation and Interval Estimation
2.	confidence Interval on Mean, Variance and Proportion
3.	testing of Hypotheses on the Mean(s) and Variance(s)
4.	testing for Goodness of Fit
5.	testing of Independence of Attributes

Course Outcomes: After completion of the course, the students will be able to:

CO1	differentiate between Point Estimate and Interval Estimate and gain an understanding of various methods of Point Estimation.
CO2	describe the various properties of Estimators along with their importance in estimation Theory.
CO3	gain an understanding of Confidence Interval, Confidence Limits and various concepts related to the Testing of Hypothesis.
CO4	describe the various steps involved in Testing of Hypothesis problem.
CO5	demonstrate the use of Chi-square distribution to conduct Tests of (i) Goodness of Fit, and (ii) Independence of Attributes.

Module I

Theory of Estimation: Introduction, Point Estimation and Interval Estimation, Methods of Estimation: Method of Maximum Likelihood, Method of Moments; Properties of Estimators: Unbiasedness, Consistency, Efficiency, Sufficiency; Minimum Variance Unbiased Estimator (MVUE), Cramer-Rao Inequality, Minimum Variance Bound (MVB) Estimator, Bayes Estimators. [8L]

Module II

Confidence Interval (CI) Estimation: Introduction, CI on Mean and Variance of a Normal Distribution, CI on a Proportion, CI on the difference between Means for Paired Observations, CI on the ratio of Variances of Two Normal Distributions, CI on the difference between Two Proportions. [8L]

Module III

Tests of Hypotheses: Introduction, Statistical Hypotheses, Type-I and Type-II Errors, One-Sided and Two-Sided Hypotheses, Tests of Hypotheses on the Mean of a Normal Distribution; Variance Known as well as Unknown Cases, Tests of Hypotheses on the Variance of a Normal Distribution, Tests of Hypotheses on a Proportion. [8L]

Module IV

Tests of Hypotheses on the Means of Two Normal Distributions; Variances Known as well as Unknown Cases, The Paired t-Test, Tests for Equality of two Variances, Tests of Hypotheses on two Proportions. [8L]

Module V

Testing for Goodness of Fit, Contingency Table Tests, Neyman-Pearson Theory of Testing of Hypotheses, Uniformly Most Powerful Tests, Likelihood Ratio Tests, Unbiased Tests. [8L]

Course code: MA 417

Course title: Numerical Solutions of Boundary Value Problems

Pre-requisite(s): Some background in numerical analysis, Ordinary and partial differential equations

Co- requisite(s): ---

Credits: L: 3 T: 0 P:0 C:3

Class schedule per week: 03 Lectures

Class: IMSc/ MSc

Semester / Level: VIII/4

Branch: Mathematics and Computing / Mathematics

Name of Teacher:

Course Objectives: This course enables the students to understand

1.	various forms of difference operators and approaches of finite difference schemes that can be used to approximate the partial differential equation by a suitable grid function defined by a finite number of grid/ mesh points that lie in the underlying domain and its boundary.
2.	recognize three basic types of partial differential equations viz., Hyperbolic, parabolic and elliptic and understand the best suited techniques to be applied to find the solutions to those equations.
3.	analyses numerical issues such as the stability, condition of convergence and the compatibility of the methods that have been introduced to find the numerical solutions of partial differential equation (s) of specific type.
4.	Visualize connection between mathematical expressions and physical meaning of the problem.

Course Outcomes: After the completion of this course, students will be able to

CO1	classify the partial differential equations and approximate the problems using appropriate finite difference scheme
CO2	obtain simple numerical approximations to the solutions to certain boundary value problems
CO3	analyse the consistency, stability and convergence properties of such numerical methods.
CO4	solve eigenvalues problem and physical problems in engineering
CO5	demonstrate the strength of mathematics in modelling and simulating real world problems of science and engineering

Syllabus

MA417

Numerical Solutions of Boundary Value Problems

3-0-0-3

Module I

Finite Differences: Review of finite difference operators and finite difference methods. [8L]

Module II

Hyperbolic PDE: Solution of one and two-dimensional wave equation (hyperbolic equations) using finite difference method, and their limitations and error analysis. [8L]

Module III

Parabolic PDE: Concept of compatibility, convergence and stability, stability analysis by matrix method and Von Neumann method, Lax's equivalence theorem, explicit, full implicit, Crank-Nicholson, du-Fort and Frankel scheme, finite difference methods to solve two-dimensional equations with error analysis. [8L]

Module IV

Elliptic PDE: Five-point formulae for Laplacian, replacement for Dirichlet and Neumann's boundary conditions, curved boundaries, solution on a rectangular domain, block tri-diagonal form and its solution using method of Hockney, condition of convergence. [8L]

Module V

Weighted Residual Methods: Collocation, least squares, Galerkins, Rayleigh-Ritz methods and their compatibility. [8L]

Text Books:

1. L. Lapidus and G.F. Pinder: Numerical Solution of Partial Differential Equations in Science and Engineering, John Wiley, 1982.
2. G.D. Smith: Numerical Solutions to Partial Differential Equations, Oxford University Press, 1986.
3. M.K. Jain, S.R.K. Iyenger and R.K. Jain: Computational Methods for Partial Differential equations, Wiley Eastern, 1994.

Course title: Mechanics

Pre-requisite(s): Nil

Co- requisite(s):

Credits: L: 3 T: 0 P: 0 C:3

Class schedule per week: 3 Lectures

Class: IMSc/MSc

Semester / Level: VIII/4

Branch: Mathematics and Computing/ Mathematics

Name of Teacher:

Course Objectives: This course enables the students to understand:

1.	motion in different curves under central forces.
2.	the general equation of motion, Compound pendulum, D'Alembert's Principle.
3.	the variational methods, Lagrange and Hamilton's equations of motion, Small oscillations.
4.	Hamilton's principle, Fermat's principle, Principle of least action, Jacobi theory.

Course Outcomes: After the completion of this course, students will be able to:

CO1	solve the problem of central forces and mechanical systems.
CO2	analyze the motion and shape of orbits in planetary motion.
CO3	determine the solution of isoperimetric and brachistochrone's problems.
CO4	analyze the motion in n-dimensional space.
CO5	demonstrate the strength of mathematics in modelling and simulating real world problems of science and engineering

Module I

Motion of a particle in two dimensions. Velocities and accelerations in Cartesian, polar, and intrinsic coordinates. Tangential and normal accelerations. Motion of a particle on a smooth or rough curve. [8L]

Module II

Equation of motion referred to a set of rotating axes, Motion of a projectile in resisting medium. Motion of a particle in a plane under different laws of resistance. [8L]

Module III

Central forces, Stability of nearly circular orbits. Motion under the inverse square law, Kepler's laws, Time of describing an arc and area of any orbit, slightly disturbed orbits. D'Alembert's principle, The general equations of motion, Motion about a fixed axis, Compound pendulum. [8L]

Module IV

Functional, Euler's equations, Isoperimetric problems (Brachistochrone's problem), Functional involving higher order derivatives. Hamilton's principle, Derivation of Lagrange's equations, Generalized coordinates, Holonomic dynamical systems: derivation of Lagrange's equations of motion; Lagrange's function and equation in terms of L. Hamilton's function H and derivatives of Hamilton's equation of motion in terms of Hamiltonian variables [8L]

Module V

Principle of least action, Fermat's principle, Small oscillations, Lagrange and Poisson Brackets, Contact transformation, Elements of Hamilton Jacobi theory. [8L]

Course title: Mathematical Ecology

Pre-requisite(s): Differential Equations

Co- requisite(s): Basics of Ecology and Environment

Credits: L: 3 T: 0 P:0 C: 3

Class schedule per week: 3 Lectures

Class: IMSc / MSc

Semester / Level: VIII/4

Branch: Mathematics and Computing/ Mathematics

Name of Teacher:

Course Objectives: This course enables the students

1.	to understand linear and nonlinear system of differential equations and qualitative behaviour of their solutions
2.	to study different types of growths associated with population dynamics
3.	to learn basics required to develop single species, interacting, cooperative and age – structured populations
4.	to analyze the population model systems in the presence of exploitation and harvesting
5.	to compare the stability behaviour of different population ecosystems

Course Outcomes: After the completion of this course, students will be able to

CO1	acquire the skills required to formulate the interactive dynamics that exists between different populations of ecosystems through mathematical models
CO2	assess and articulate the modelling techniques appropriate for a given ecological system
CO3	make predictions of the behaviour of a given ecological system based on analysis of its mathematical model
CO4	do comparative analysis about the stability behaviour between different population ecosystems
CO5	demonstrate the strength of mathematics in simulating real world problems of ecology and environment

Module I

Autonomous linear and nonlinear systems of differential equations: Equilibrium Solutions, Eigenvalues, Stability analysis, Lyapunov's functions, Phase Plane analysis, Routh – Hurwitz criterion. [8L]

Module II

Single Species Models: Exponential, logistic and Gompertz growths, Bifurcations, Harvest models, Bifurcations and Break points, Constant Rate Harvesting, Fox Surplus Yield Model, Allee Effect. [8L]

Module III

Interacting Population Models: Lotka Volterra predator-prey models, plane analysis, General predator prey models and their equilibrium solutions, existence of cycles, Bendixson- Dulac's negative criterion, Hopf bifurcation theorem, Bifurcation diagrams, Functional responses, Periodic orbits, Poincare – Bendixson theorem, Freedman and Wolkowicz model. [8L]

Module IV

Competition Models: Lotka – Volterra Competition model, Competition Models with Unlimited growth, exploitation competition models, Mutualism models with various types of mutualisms. [8L]

Module V

Exploited Population Models: Harvest models with optimal control theory, open access fishery, sole owner fishery, Pontryagin's maximum principle.

Structured Population Models: Formulation of spatially and age structured models.

Course code: MA 426

Course title: Operator Theory

Pre-requisite(s):

Co- requisite(s): ---

Credits: L: 3 T: 0 P: 0 C:3

Class schedule per week: 3 Lectures

Class: M.Sc.

Semester / Level: II /4

Branch: Mathematics

Name of Teacher:

Course Objectives: This course enables the students to understand

1.	concept of different kinds of bounded linear operators on Hilbert spaces such as, self-adjoint operator, unitary operator, normal operator etc.
2.	spectrum and different kinds of subdivisions of spectrum of various operators
3.	idea of spectral representation of compact self-adjoint operators and bounded self-adjoint operators.
4.	concept of unbounded linear operators in Hilbert spaces

Course Outcomes: After the completion of this course, students will be able to

CO1	relate the behaviour of different kinds of operators acting on finite dimensional and infinite dimensional spaces
CO2	understand the difference between the eigenvalue of an operator and spectrum of an operator
CO3	apply the theory of unbounded operator to differential equations and Difference equations
CO4	apply the concept of unbounded linear operators in Hilbert spaces
CO5	apply the theory to study the qualitative behaviour of solutions of different mathematical models in Biological and Ecological system and engineering problems.

Module I

Review of functional analysis: Normed spaces, Banach spaces, Inner product spaces, Hilbert spaces, Linear transformations, Hahn-Banach theorem, Baire-Category Theorem, Open mapping Theorem, Closed Graph Theorem, Uniform boundedness Theorem. Uniform, weak and strong convergences. [8L]

Module II

Spectral theory of bounded operators on normed spaces, spectrum and resolvent set and their properties, spectral radius, spectral mapping theorem. Subdivisions of spectrum in complex plane: point spectrum, continuous spectrum, residual spectrum, approximate point spectrum etc. Integration of operator valued function, spectral projection.

Compact linear operator on normed spaces, the ideal of compact operators, spectral properties of compact linear operators. Fredholm alternative. [8L]

Module III

Bounded operators on Hilbert spaces; adjoint operators; normal, unitary and self adjoint operators; positive operators and their square root; projection operators, Numerical range, numerical radius. Hilbert-Schmidt operators. Spectral results of normal and self-adjoint operators. [8L]

Module IV

Spectral representations of compact self-adjoint operators, singular value representation of compact operators. Spectral family of a bounded self-adjoint operator, Spectral representation of a bounded self-adjoint operator, Spectral measure. [8L]

Module V

Unbounded linear operators in Hilbert space: examples, Hilbert-adjoint operators of unbounded linear operators, symmetric and self-adjoint operators, closed linear operators, spectral properties of unbounded self-adjoint linear operators, Multiplication operators and differential operators. [8L]

Course Co-ordinator:

Course Objectives:

1	Introduction to binary relations and preference, Optimality condition. Pareto optimal or efficient solutions.
2	Introduction, Satisfying solution. Goal settings, Preference ordering and optimality in satisfying solution. Mathematical program and interactive methods. Compromise solutions and interactive methods.
3	about a value function.
4	learning to Construct general value functions.
5	domination structures and non-dominated solutions

Course Outcomes: After the completion of the course, the students will be able to:

CO1	learn about what is Pareto optimal or efficient solutions.
CO2	learn about Goal setting and compromise solution.
CO3	learn the Concept of Value Function.
CO4	learn the basic techniques for constructing value functions.
CO5	learn about the Domination structures and non-dominated solutions.

Module-I:**Introduction**

The needs and basic elements. Binary Relations: Preference as a Binary Relation, Characteristics of Preferences, Optimality condition. Pareto optimal or efficient solutions: Introduction, General Properties of Pareto Optimal Solutions, Conditions for Pareto Optimality in the outcome space, Conditions for Pareto Optimality in the Decision Space. [8L]

Module -II:**Goal setting and compromise solution**

Introduction, Satisfying solution. Goal settings, Preference ordering and optimality in satisfying solution. Mathematical program and interactive methods. Compromise solutions. Basic concepts. General properties of compromise solutions. Properties related to p. Computing compromise solutions, interactive methods. [8L]

Module -III:**Value Function.**

Revealed preference from a value function. Condition for value functions to exist. Additive and Monotonic value functions and preference separability. Conditions for Additive and monotonic value functions. Structure of preference separability and value functions. [8L]

Module -IV:**Some basic techniques for constructing value functions.**

Constructing general value functions. Constructing indifference curves (surfaces). Constructing the tangent planes and gradients of value functions. Constructing the value function. Constructing the additive value functions. A first method for constructing the additive value function. A second method for constructing the additive value function. Approximation method. Approximation method: A general concept. Approximation for additive value functions. Eigen weight vectors for additive value functions. Least distance approximations. [8L]

Module -V:**Domination structures and non-dominated solutions.**

Introduction, Domination structures. Constant dominated cone structures. C. A characterization of n-points and their polars. General properties of N-points . Cone convexity and N-points. N points in decision space. Existence properness and duality questions. Local and global N-points in domination structures. Interactive approximation for N-points with information from domination structures. [8L]

COURSE INFORMATION SHEET

Course code: MA 503

Course title: Statistical Computing

Pre-requisite(s): Basics of statistics, probability and algorithms

Co- requisite(s): NIL

Credits: 3 L: 3 T: 0 P: 0 C:3

Class schedule per week: 3 Lectures

Class: IMSc / MSc

Semester / Level: IX/ 5

Branch: Mathematics and Computing/ Mathematics

Name of Teacher:

Course Objectives: This course enables the students to get the detailed idea about

1.	concept of randomness; its types with applications
2.	pseudo random generator and statistical tests of randomness
3.	generating random variables from different probability distributions
4.	fitting statistical models and verifying their goodness of fit
5.	sampling algorithms and outlier analysis

Course Outcomes: After completion of the course, the learners will be able to

CO1.	classify randomness and explore the real life applications
CO2.	develop a new random number generator
CO3.	simulate variates from different probability distributions
CO4.	learn to fit various statistical models like time series models and regression models to real life numerical data
CO5.	select an appropriate sampling algorithm for a real life population and also detect influential observations (outliers) in data and analyses them

Syllabus

MA503

Statistical Computing

3-0-0-3

Module I

Understanding randomness, concepts of genuine and false randomness with applications, concept of Kolmogorov's complexity and its applications. [8L]

Module II

Pseudo Random Number Generators (PRNG) including Linear Congruential Generators, Feedback Shift register method, Statistical tests of randomness with applications. [8L]

Module III

Generating random variables from different probability distributions both discrete and continuous, inverse cdf technique, acceptance sampling method. [8L]

Module IV

Modeling in Statistics: regression models, time series models, probability models, goodness of fit tests, graphical statistics. [8L]

Module V

Sampling algorithms, Markov Chain Monte Carlo. Metropolis-Hastings algorithm, Gibbs Sampling algorithm with applications, Outlier Analysis. [8L]

Text Books:

1. William J. Kennedy and James, E. Gentle "Statistical Computing", Marcel Dekker Inc,
2. D. Kundu and A. Basu, Statistical Computing: Existing Methods and Recent Development, Alpha Science International Ltd,

Course title: Finite Element Methods

Pre-requisite(s):

Co- requisite(s): ---

Credits: L: 3 T: 0 P: 0 C:3

Class schedule per week: 3 Lectures

Class: IMSc / MSc

Semester / Level: IX/ 5

Branch: Mathematics and Computing / Mathematics

Name of Teacher:

Course Objectives: This course enables the students to understand

1.	the Methods of weighted residuals, collocations, least squares method.
2.	variational Methods.
3.	linear, quadratic and higher order elements.
4.	interpolation functions, numerical integration, and modelling considerations.

Course Outcomes: After the completion of this course, students will be able to

CO1	determine the solution of engineering problems.
CO2	choose the appropriate methods to solve the physical problems.
CO3	solve the problems of differential equations using FEM.
CO4	determine the solution of initial and boundary value problems.
CO5	demonstrate the strength of mathematics in modelling and simulating real world problems

Module I

Introduction to finite element methods, comparison with finite difference, methods Initial and Eigen value problems, Integral Relations, Functional, Base Functions, The Variational symbol, Formulation of Boundary value problems. Methods of weighted residuals, collocations, least squares method. [8L]

Module II

Variational Methods of approximation-the Rayleigh-Ritz Method, the method of Weighted Residuals (Gelarkin's Method). Applications to solving simple problems of ordinary differential equations. [8L]

Module III

Linear, quadratic and higher order elements in one-dimensional and assembly, solution of assembled system. [8L]

Module IV

Simplex elements in two and three dimensions, quadratic triangular elements, rectangular elements, serendipity elements, isoperimetric elements, and their assembly. Discretization with curved boundaries. [8L]

Module V

Interpolation functions, numerical integration, and modelling considerations. Solution of two-dimensional partial differential equations under different Geometric Conditions. [8L]

COURSE INFORMATION SHEET

Course code: MA505

Course title: Calculus of Variations and Optimal Control

Pre-requisite(s): Some background on basic optimization, differential equations, mechanics

Co- requisite(s): ---

Credits: L: 3 T:0 P:0 C:3

Class schedule per week: 3 Lectures

Class: IMSc. / MSc

Semester / Level: IX / 5

Branch: Mathematics and Computing / Mathematics

Name of Teacher:

Course Objectives: This course enables the students to understand

1.	the theory of optimizing a functional, typically integral starting with the basic problem of brachistochrone in the calculus of variations.
2.	knowledge to solve a class of optimization problem in which the function(s) to be optimized under definite integral are restricted with constraint(s)
3.	learn to establish the necessary conditions for local minimizers using Legendre, Jacobi's and Weierstrass conditions. solve problems with transversality condition
4.	solve optimal control problems

Course Outcomes: After the completion of this course, students will be able to

CO1	understand the calculus of variation and optimal control and their related theories.
CO2	handle a class of optimization problem in which the function(s) to be optimized under definite integral are restricted with constraint(s)
CO3	solve optimal control problem using dynamic programming
CO4	apply calculus of variation and optimal control in the areas of optimization
CO5	apply the knowledge of calculus of variation and optimal control to solve a wide range of real world problems of science and engineering

Module I

Introduction to calculus of variation, the brachistochrone problem, Fundamental Lemma, Necessary condition for an extremum, Euler-Lagrange equation for the function of single and several variables, Variational problems in parametric form and with undetermined end points.
[8L]

Module II

Simple isoperimetric problems with single and multiple constraints, application of the problems.
[8L]

Module III

Functionals depending on the higher derivatives of the dependent variables, Euler- Poisson equation, Legendre necessary condition, Jacobi's necessary condition, Weierstrass's necessary condition, a weak extremum, a strong extremum, transversality condition in general case. [8L]

Module IV

Preliminary Introduction to optimal control problem, necessary condition for optimal control, Linear regulator, Pontryagin minimum principle and state inequality constraints, Hamilton-Jacobi-bellman equation.
[8L]

Module V

Solving optimal control problem using dynamic programming, structure and properties of optimal control system, various types of constraints, singular solutions, minimum time problem, Bang – bang Controls.
[8L]

COURSE INFORMATION SHEET

Course code: MA 506

Course title: Advanced Difference Equations

Pre-requisite(s): Sequence and Series of numbers and functions.

Co- requisite(s): ---

Credits: L: 3 T: 0 P: 0 C:3

Class schedule per week: 3 Lectures

Class: IMSc/ MSc

Semester / Level: IX / 5

Branch: Mathematics and Computing / Mathematics

Name of Teacher:

Course Objectives: This course enables the students to understand

1.	application of sequences and series of numbers and functions.
2.	stability theory of difference equations
3.	partial difference equations
4.	applications of partial difference equations in problems of engineering.

Course Outcomes: After the completion of this course, students will be able to

CO1	handle different types of systems: Autonomous (time-invariant) systems, Linear periodic systems.
CO2	apply the theory of difference equations in different model: Markov Chains, Absorbing Markov Chains, A Trade model.
CO3	apply the theory to study the quantitative and qualitative study of solutions of different discrete models in Engineering and Biology and Ecology.
CO4	differentiate between the qualitative and quantitative behaviour of solutions of the difference equations and the corresponding differential equations.
CO5	apply the theory to study the qualitative theory of solutions of difference equations and partial difference equations of higher order.

Syllabus

MA 506

Advanced Difference Equations

3-0-0-3

Module 1

Introduction and Applications of Difference Equations: Introduction, Mathematics: Summing series, Fibonacci numbers, Chebyshev polynomials, Newton method. Perturbation Techniques: expansion of ϵ , slowly varying amplitude and phase. The Logistic equation: Introduction, The two-cycle, higher cycles, Physical systems: Modeling and time scales, Law of cooling, second-order chemical reaction, rate of dissolution, heat equation. Biological Sciences: Single-species Population models, Harvesting, red blood cell production, Ventilation column and bold CO_2 levels, Simple epidemic model, waves of disease. [8L]

Module II

Systems of Linear Difference equations: Autonomous (time-invariant) systems: The discrete analogue of the Putzer algorithm, Development of the algorithm for A^n , The Basic theory, The Jordan form: diagonalizable matrices, The Jordan form, Block-Diagonal matrices, Linear periodic systems, Applications in Markov Chains, Absorbing Markov Chains, A Trade model, The Heat equation. [8L]

Module III

Stability Theory: Initial value problems for linear systems, Stability of linear systems, Phase plane analysis for linear systems, Fundamental matrices and Floquet Theory, Stability of Nonlinear systems. Applications of Floquet theory in Engineering problems. Lyapunov's Direct or Second method: Applications to models in one species with two age classes, Host-parasitoid systems, A business cycle model, Nicholson-Bailey model and Floor Beetle case study. [8L]

Module IV

The Self-Adjoint Second Order Linear Equations: Introduction, Sturmian Theory, Green's functions, Disconjugacy, The Riccati equation. The Sturm-Liouville Problem: Introduction, Finite Fourier analysis, Nonhomogeneous problem. Discrete Calculus of Variations: Introduction, Necessary conditions for Disconjugacy, Sufficient conditions for disconjugacy. Boundary Value Problems for Nonlinear Equations: Introduction, The Lipschitz case, Existence of solutions, Boundary value problems for Differential equations. [8L]

Module V

Partial Difference Equations: Discretization of Partial Differential Equations, Solutions of partial difference equations. Numerical Solutions of Partial Difference Equations: Convergence and consistency of solutions of initial-value problems, Initial-Boundary value problems, The Lax theorem, Examples. Computational Interlude-Review of computational results, HW0.0.1, Implicit Scheme, Neumann boundary conditions. Stability: Analysis of stability, Finite Fourier series and stability, Examples, Consistency and stability of some parabolic equations and hyperbolic equations. Dispersion and Dissipation: Introduction, Dispersion and dissipation for difference equations, Artificial Dissipation. [8L]

COURSE INFORMATION SHEET

Course code: MA507

Course title: Computational Fluid Dynamics

Pre-requisite(s): Partial Differential Equations

Credits: L:3 T:0 P:0 C:3

Class schedule per week: 3 lectures

Class: IMSc/ MSc

Semester/level: IX/5

Branch: Mathematics and Computing / Mathematics

Name of the Faculty:

Course Objectives: This course enables the students to understand

1.	the basis of finite difference method to solve the partial differential equation.
2.	the uses of Finite Volume method and limitation of finite difference method.
3.	the analysis, applications and limitations of numerical schemes.
4.	the numerical approach to solve compressible Euler equations.
5.	the numerical approach to solve the incompressible Navier-Stokes equations.

Course Outcomes: After the completion of this course, students will be able to

CO1	learn the background and get an introduction for the use of numerical methods to solve partial differential equations.
CO2	apply the concepts of finite difference and finite volume methods to solve the fluid mechanics problem and other real word problems
CO3	analyse the consistency, stability and convergence analysis of numerical schemes.
CO4	choose appropriate numerical methods to solve the fluid flow problem.
CO5	understand the limitation of numerical methods and various techniques in actual implementation.

Module I

Basic equations of fluid dynamics: General form of a conservation law; Equation of mass conservation; Conservation law of momentum; Conservation equation of energy. Incompressible form of the Navier-Stokes equations, 2D incompressible Navier-Stokes equations, Stream function-vorticity formulation, Mathematical and physical classification of PDEs. **[6L]**

Module II

Basic Discretization techniques: Finite Difference Method (FDM); The Finite Volume Method (FVM) and conservative discretization. Analysis and Application of Numerical Schemes: Consistency; Stability; Convergence; Fourier or von Neumann stability analysis; Modified equation; Application of FDM to wave, Heat, Laplace and Burgers equations. **[15L]**

Module III

Integration methods for systems of ODEs: Linear multistep methods; Predictor-corrector schemes; The Runge Kutta schemes. **[6L]**

Module IV

Numerical solution of the compressible Euler equations: Mathematical formulation of the system of Euler equations; Space centred schemes; upwind schemes for the Euler equations flux vector and flux difference splitting. **[6L]**

Module V

Numerical solution of the incompressible Navier-Stokes equations: Stream function vorticity formulation; Primitive variable formulation. Pressure correction techniques like SIMPLE, SIMPLER and SIMPLEC. **[7L]**

Mapping Between COs and Course Delivery (CD) methods

Course Outcome	Course Delivery Method Used
CO1	CD1, CD2
CO2	CD1, CD2
CO3	CD1, CD2
CO4	CD1, CD2 and CD8
CO5	CD1, CD2 and CD8

COURSE INFORMATION SHEET

Course code: MA 508

Course title: Qualitative Theory of Differential equations

Pre-requisite(s): Basics of Ordinary and Partial Differential Equations

Co- requisite(s): ---

Credits: L: 3 T: 0 P: 0 C:3

Class schedule per week: 3 Lectures

Class: IMSc / MSc

Semester / Level: IX/5

Branch: Mathematics and Computing/ Mathematics

Name of Teacher:

Course Objectives : This course enables the students to understand

1.	the advanced theory of ordinary and partial differential equations
2.	the concept of Existence and uniqueness of solutions of differential equations.
3.	the concept of stability theory of differential equations.
4.	Green's functions of boundary value problems.

Course Outcomes: After the completion of this course, students will be able to

CO1	handle and analyse the problems related to ordinary and partial differential equations.
CO2	study the qualitative behaviour of solutions of ordinary and partial differential equations
CO3	handle the partial differential equations in theory of Biological, Ecological systems and different engineering problems.
CO4	use of Green's functions in the study of qualitative behaviour of solutions of boundary value problems.
CO5	enhance and develop the ability of using the language of mathematics in analysing the real world problems of sciences and engineering.

Syllabus

MA508

Qualitative Theory of Differential Equations

3-0-0-3

Module 1

Systems of Ordinary Differential Equations: Existence, uniqueness and continuity, Gronwall Inequality

Linear Systems and Phase Space Analysis: Introduction, Existence and uniqueness of Linear Systems, Linear homogeneous and non homogeneous systems, Linear Systems with Constant coefficients. [8L]

Module II

Existence Theory: Existence theory for systems of first order equations, uniqueness and continuation of solutions. Stability of linear and almost linear systems: Introduction, Definition of stability, linear systems, almost linear systems, conditional stability. [8L]

Module III

Lyapunov's Second method: Lyapunov's theorems, Proofs of Lyapunov's theorems, Invariant sets and stability, global asymptotic stability, nonautonomous systems. [8L]

Module IV

Sturm-Liouville Systems, Eigen values and Eigen functions, Singular Sturm-Liouville Systems. Method of separation of variables: Separation of variables, The vibrating string problem, heat equation, Elliptic Equations: Elliptic equations with Dirichlet, Neumann and Cauchy boundary conditions, Maximum and minimum principles. [8L]

Module V

Green's function and Boundary Value Problems: Introduction, Properties of Green's function, Method of Green's functions, Dirichlet's Problem for Laplace Operator, Dirichlet's problem for Helmholtz operator, Method of Eigen functions, Higher-Dimensional Problems, Neumann Problem. [8L]

Text Books:

1. F. Brauer and J. A. Nohel, The Qualitative Theory of Ordinary Differential equations, Dover Publications, New York, 1989.
2. Tyn Myint U and Debnath Loknath, Linear partial Differential Equations for Scientists and Engineers, Birkhauser, 4th Edition, 2007.

Reference Books:

1. Ravi P. Agarwal and Donal O'Regan, An Introduction to Ordinary Differential Equations, Universitext, Springer, 2008.
2. Ravi P. Agarwal and Donal O'Regan, Ordinary and Partial Differential equations, With Special Functions, Fourier Series and Boundary Value Problems, Universitext, Springer, 2009.

Gaps in the Syllabus (to meet Industry/Profession requirements): NA

POs met through Gaps in the Syllabus: NA

Topics beyond syllabus/Advanced topics/Design

1. Theory of Differential Equations in mathematical models arise in real world.

POs met through Topics beyond syllabus/Advanced topics/Design

Course Outcome (CO) Attainment Assessment tools & Evaluation procedure

Direct Assessment

Assessment Tool	% Contribution during CO Assessment
End Semester Examination	50
Quiz (s)	10+10+10
Assignment	10
Seminar before a committee	10

Assessment Components	CO1	CO2	CO3	CO4	CO5
Seminar before a committee	✓	✓	✓	✓	✓
End Semester Examination	✓	✓	✓	✓	✓
Quiz (s)	✓	✓	✓	✓	✓
Assignment	✓	✓	✓	✓	✓

Indirect Assessment –

1. Student Feedback on Course Outcome

Mapping of Course Outcomes onto Program Outcomes

Course Outcome	Program Outcomes					
	PO1	PO2	PO3	PO4	PO5	PO6
CO1	3	3	2	1	1	1
CO2	3	3	3	2	1	1
CO3	3	3	3	2	1	1
CO4	2	2	3	3	1	1
CO5	2	2	3	3	1	1

Correlation Levels 1, 2 or 3 as defined below:

1: Slight (Low) 2: Moderate (Medium) 3: Substantial (High)

If satisfying < 34%=1, 34-66% =2, > 66% = 3

CD Code	Course delivery methods
CD1	Lecture by use of boards/lcd projectors/ohp projectors
CD2	Tutorials/assignments
CD3	Seminars
CD4	Mini projects/projects
CD5	Laboratory experiments/teaching aids
CD6	Industrial/guest lectures
CD7	Industrial visits/in-plant training
CD8	Self- learning such as use of nptel materials and internets
CD9	Simulation

Mapping Between COs and Course Delivery (CD) methods

Course Outcome	Course Delivery Method Used
CO1	CD1, CD2
CO2	CD1, CD2
CO3	CD1, CD2
CO4	CD1, CD2 and CD8
CO5	CD1, CD2 and CD8

Course code: MA 523

Course title: Computational Mathematics

Pre-requisite(s):

Co- requisite(s): ---

Credits: L: 3 T: 0 P: 0 C:3

Class schedule per week: 3 Lectures

Class: IMSc/MSc

Semester / Level: IX, III/5

Branch: Mathematics and Computing/Mathematics

Name of Teacher:

Course objectives: This course is intended as an advance course enables the students to get the detailed idea about:

1.	partial differential equations
2.	boundary value problem
3.	calculus of Variations
4.	eigenvalues and eigen vectors of Matrices
5.	numerical method: Finite difference method
6.	introduction to finite element method

Course Outcomes: After completion of the course, the learners will be able to:

CO1.	formulate the continuous physical systems using mathematical notations as partial differential equations since most entities in the real world are dependent of several independent entities and handle real dynamic problems with diversity and complexity which leads to boundary value problem
CO2.	gain an understanding of eigen value problem and gain skills in modelling and solving eigen value problem.
CO3.	handle huge amount of problems in science and engineering physics where one has to minimize the energy associated to the problem under consideration.
CO4.	solve problems involving differential equations, ordinary and partial with regular as well as irregular boundaries.
CO5.	demonstrate a depth of understanding in advanced mathematical topics and enhance and develop the ability of using the language of mathematics in Science and engineering

Syllabus

MA 523

Computational Mathematics

3-0-0-3

Module I

Partial Differential Equations:

Classification of partial differential equations. Its characteristics and reduction to canonical forms. Solution of higher order p.d.e with variable co-efficients by Monge's method. Boundary value Problems. Laplac's equation in different co-ordinate systems. Two-dimensional heat conduction equation. Vibrating membrane. [8L]

Module II

Eigen values and eigen vectors of Matrices:

Basic properties of eigen values and eigen vectors. The power method. The Rayleigh quotient. Inverse iteration. Jacobi's methods, Given and Household's methods. Leverrier – Faddeeva method. Sylvester's expansion theorem and Computation of $f(A)$. [8L]

Module III

Numerical method: Finite difference method for parabolic, elliptic and hyperbolic equations. Explicit and implicit schemes. Convergence and Stability of schemes. [8L]

Module IV

Calculus of Variations:

The Euler equation of Variations, the extrema of integrals under constraints. Sturm-Liouville Problems. Hamilton's principle and Lagrange's equations. [8L]

Module V

Introduction to finite element method.

Concept of functionals. Rayleigh Ritz and Galerkin's Techniques. Finite element method for one dimensional problems. Application to two dimensional problems. [8L]

Test Books:

1. Advanced Engineering Mathematics – E. Kreyszig
2. Linear Partial Differential Equations for Scientists and Engineers, Lokenath Debnath and Tyn Myint U., Fourth Edition, Birkhauser, Boston.
3. I.N.Sneddon, Elements of Partial Differential Equations, McGraw Hill, NewYork, 2006.
4. J.N. Reddy, An Introduction to the Finite Element Method ; McGraw Hill Energy and variational Methods in Applied mechanics .

Reference Books:

1. J D Hoffman, Numerical Methods for Engineers and Scientists, McGraw Hill Inc., NewYork, 2001.
2. O.C. Zienkiewicz , The Finite Element Method,
3. J N Reddy , Energy and variational Methods in Applied mechanics .
